

dynamic

mini bems

Minibems connected service

Dynamic manages the flow rate and temperature of heat networks in real-time to maximise efficiency, reduce fuel usage and cut carbon. By software controlling all elements of the network, it can decrease flow rates by more than half whilst keeping homes warm and hot water on. Saving money for you and your residents.

Dynamic can identify and resolve any poor performing parts of a heat network and each individual unit is automatically monitored and updated to improve performance in real-time.

Features

Real-time flow control

Weather compensation

Optimisation

Parametrisation

Energy efficiency targeting

HIU efficiency reporting

Real-time dashboard

Remote commissioning

Smartphone app with energy usage diagnostics*

Heating machine learning*

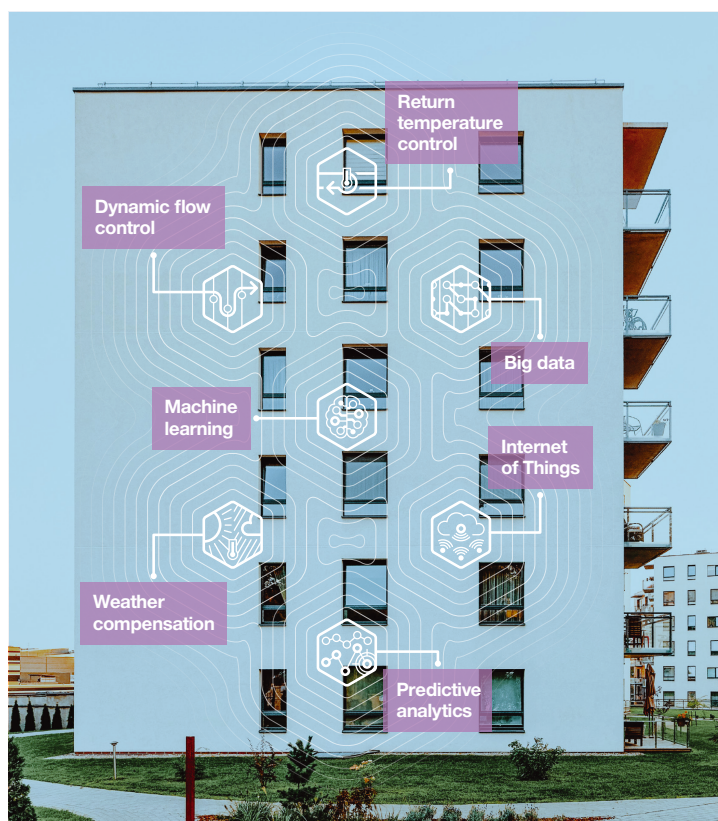

Hot water machine learning*

Demand side response*

Secure Web Portal Access

Freephone 0800 number

*New feature coming 2022
